

Chapter 1

Questions to think about

- 1.

Chapter 2

Keywords

1. Double dimer model
2. Ising model
3. Hexahedron recurrence, octahedron recurrence
4. Pfaffian
5. Kasteleyn determinant
6. lattice permutations
7. phase transition

Chapter 3

Survey

3.1 T-systems, networks and dimers [DF14]

3.1.1 Excerpts

- In the case of type A, the T-system equation is also known as the octahedron recurrence, and appears to be central in a number of combinatorial objects, such as the lambda-determinant and the Alternating Sign Matrices [24][8], the puzzles for computing Littlewood-Richardson coefficients [20], generalizations of Coxeter-Conway frieze patterns [5][1][3], and the domino tilings of the Aztec diamond [12][25]

3.2 Q-systems as Cluster Algebras II: Cartan Matrix of Finite Type and the Polynomial Property [FK09]

A new interpretation for the T-system arose from realizing that the corresponding discrete evolution could be viewed as a particular mutation in a suitably defined cluster algebra

- 3.3 Arctic curves of the octahedron equation [DFSG14]
- 3.4 Double-dimers, the Ising model and the hexahedron recurrence [KP13]
- 3.5 Perfect Matchings and the Octahedron Recurrence [Spe04]
- 3.6 Uniformly positive correlations in the dimer model and phase transition in lattice permutations in Z^d , $d > 2$, via reflection positivity [Tag19]
